

Technical Memo

Date: April 12, 2017

Project: I-29 Exit 77 (41st Street) Interchange Traffic Study

To: Study Advisory Team

From: Unruh, Laughlin

Subject: Crash Analysis of Existing Conditions

This memorandum documents the safety analysis conducted for the study area surrounding the I-29 Exit 77 interchange in southwest Sioux Falls, SD. The safety analysis was conducted to help determine if any safety-related improvements could be incorporated into future construction.

Methodology:

Crash data for the years 2010 through 2015 were provided by SDDOT and reviewed to identify any existing crash concentrations/crash trends and develop potential crash mitigation measures. Analyses were conducted for the following roadway facilities:

- Arterial street intersections
- Arterial street segments
- Interstate mainline segments
- Interstate ramp segments

Critical crash rates were calculated for each segment or intersection and used to identify portions of the study area that displayed crash rates higher than the critical rate. Each of the above-critical locations is discussed in subsequent sections of this memorandum.

Segment and Intersection Crash Rates:

The study area was divided into segments representing:

- Arterial street intersections (Figures 6, 7, Table 1)
- Arterial street segments (Figures 8, 9, Table 2)
- Interstate mainline segments (Figure 10, Table 3)
- Interstate ramp segments (Figure 11, Table 4)

Mainline and ramp sections were each analyzed separately to allow calculation of representative crash rates and critical rates for each type of Interstate feature. Rate calculations included other Interstate highway sections in the Sioux Falls urban area, resulting in more robust statistical representation of crash rates.

The arterial street intersections named in the M&A document were grouped for calculation of crash rates and critical rates.

Details of the crash records for each segment and intersection are contained in the Appendix.

Segment and Intersection Critical Crash Rates:

Critical crash rates were calculated based on the statistical populations in each spreadsheet, using the methods shown in the Highway Safety Manual (American Association of State Highway and Transportation Officials (AASHTO), 2010). Those segments and intersections that lay outside the critical rates are shown in red coloration in the last column of each spreadsheet. All the segments and intersections that lay within the critical rate are shown in green. The locations of non-critical or critical crash rates are also illustrated on the figures.

Crash Trends:

Review of the crash summaries for each Interstate and arterial street section revealed a few crash trends:

- Slightly elevated incidence of single vehicle crashes on the Interstate during inclement weather.
- Rear-end crashes at arterial intersections with the highest levels of congestion.
- Angle crashes at driveways in the arterial street segments near 41st Street/Louise Ave.
- Rear-end crashes on 41st Street in the arterial street segments bounding the Interstate 29 interchange.

Potential Mitigation Measures:

The general crash trends identified above suggest several potential strategies for reducing crash rates within the study area:

- Consider ITS-related means of communicating slippery roadway conditions to drivers and continue aggressive winter maintenance.
- Addition of high-friction surface courses on bridges, curves and weaving areas may help reduce crashes that occur during inclement weather. A section of high-friction surfacing has been installed on I-229 and may provide useful guidance about employing this technique for safety enhancement.
- Additional access management measures on 41st Street and Louise Avenue, particularly near the 41st/Louise intersection.
- Reconfiguration of the 41st Street interchange on I-29 to reduce 41st Street queues and enhance 41st Street traffic flow.

Each of the arterial intersections and Interstate segments that were identified as having crash rates outside of the critical rates are discussed in the following points.

Arterial Intersections:

- 41st Street/Marion Road – 53% of the crashes at this intersection involved rear-end incidents, while 37% involved angle incidents. Peak hour queues and congestion may be leading to increased crash rates.
- 41st Street/I-29 SB – 78% of the crashes at this intersection involved rear-end incidents, while 17% involved angle incidents. Peak hour queues and congestion may be leading to increased crash rates.
- 41st Street/I-29 NB – 53% of the crashes at this intersection involved rear-end incidents, while 40% involved angle incidents. Peak hour queues and congestion may be leading to increased crash rates.
- 41st Street/Shirley Avenue – 63% of the crashes at this intersection involved angle incidents, while 31% involved rear-end incidents. The intersection configuration and offset of Shirley Avenue may be leading to increased crash rates. Peak hour queues and congestion may also play a role in crash incidence.
- 41st Street/Louise Avenue – 54% of the crashes at this intersection involved rear-end incidents, while 37% involved angle incidents. Peak hour queues and congestion may be leading to increased crash rates.

Arterial Street Segments:

- Louise Avenue – Wal-Mart driveway to 41st Street – angle crashes at driveways appear to be leading to higher-than-normal crash rates. Queues from the adjacent intersections frequently back up into this segment making driveway maneuvers difficult.
- 41st Street – Terry Avenue to I-29 SB – peak hour queues from the I-29 interchange result in a high rate of rear-end crashes.
- 41st Street – I-29 NB to West Empire Place – peak hour queues from the I-29 interchange result in a high rate of rear-end crashes.
- 41st Street – Shirley Avenue to Louise Avenue – angle crashes at driveways and rear-end crashes appear to be leading to higher-than-normal crash rates. Queues from the adjacent intersections frequently back up into this segment making driveway maneuvers difficult and creating unexpected encounters with the back of the queue.

Interstate Segments:

- I-29 NB, 41st Street to 26th Street – single vehicle crashes with fixed objects appear to be leading to an elevated crash rate in this segment.
- I-29 NB, 26th Street off ramp to 26th Street on ramp – single vehicle crashes with fixed objects during slippery roadway conditions represent the predominant crash type.

Interstate Ramps:

No critical Interstate ramp segments were identified.

Intersection Summaries

Arterial Segment Summaries

Interstate Segment Summaries

Interstate Ramp Summaries

Crash Records

Explanatory Note

The following reports include all crashes located in the geodatabase in the vicinity of a particular facility. Data from these reports has been screened to eliminate crashes that appear to not be directly attributable to the facility. For instance, a crash coded as being related to operation of a driveway may be included in an intersection area, but must be eliminated in consideration of safety of the intersection itself. The crash records that remain after screening have been used in the critical rate calculations.
